

Report on installation of 小島 *Bird Free* at Quiron Dexeus Hospital, Barcelona, carried out in May 2018.

The objective was to eliminate the severe pigeon infestation in the wells of 14 skylights, 12 of which (2 and 4 to 14) are shown above.

Skylights 1 and 3 (not visible in the photo on page 2) are shown above.

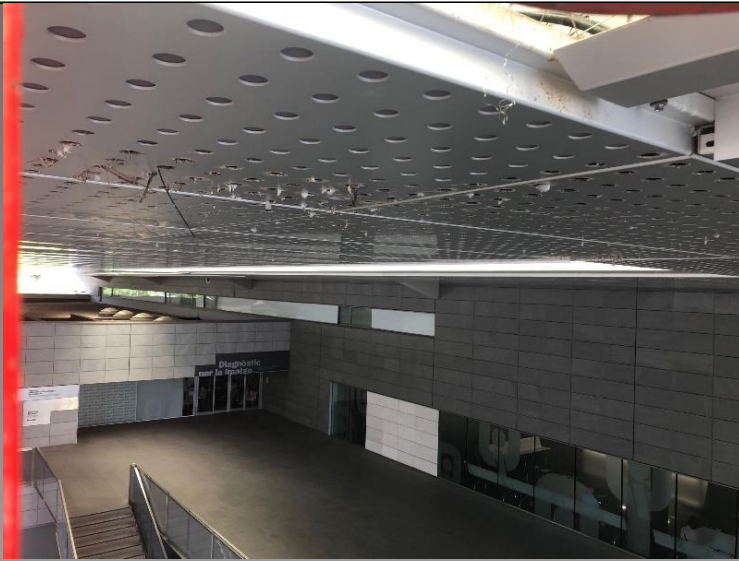

Treatment of skylights 3, 5 6, 8 and 9 was done from ladders. The ledges above the lights on each side of the skylights were cleaned of faeces and treated with dishes of 小島 *Bird Free* at 25cm centres to prevent pigeons from roosting.

Wherever nests were removed from the flat surfaces at the ends of the skylights, the nesting sites were disinfected (after removing spikes) and treated with dishes of 小島 *Bird Free* at 15cm centres to prevent further nesting. Dishes were fixed at 20cm centres close to the nesting sites.

A total of 16 nests were removed from the 14 skylights.

Several nests were observed close to the skylights inside the metal ceiling. The gaps through which the pigeons entered these nests were closed off with metal wool to prevent further nesting inside the ceiling.

Conclusion

Prior to the installation of *Bird Free*, the hospital was fighting a daily battle to clean up pigeon droppings in the area below the skylights. Although spikes had failed to prevent pigeons from nesting inside the wells of the skylights, after *Bird Free* was applied the pigeons did not return.

Having expressed complete satisfaction with results, the client commissioned a second installation of *Bird Free* in another part of the hospital.
